

DLPC120-Q1 汽车 DMD 控制器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准：
 - 温度等级 2：-40°C 至 105°C (环境温度)
- 与三个 DMD 器件兼容：
 - DLP3030-Q1：0.3 WVGA S450
 - DLP3020-Q1：0.3 WVGA S247
 - DLP3021-Q1：0.3 WVGA S247
- 视频输入接口：
 - 24 位并行 (RGB888、RGB666 或 RGB565)
 - 60Hz 帧速率
 - 从 QVGA 至 WVGA 的输入分辨率
 - 像素时钟高达 40MHz
- 视频处理：
 - 图像缩放
 - 可编程去伽玛曲线
 - 边框调整
 - 水平和垂直图像翻转
- DMD 接口：
 - 78MHz DDR DMD 接口
 - 一致的 DMD 数据加载和复位控制过热工作范围
 - 断电时自动停止 DMD
 - DMD 温度管理
- 外部存储器支持
 - DDR2：312MHz 时钟 (624MHz 数据速率)
 - 串行闪存 39MHz 时钟
- 系统控制
 - I²C 通讯接口
 - 可编程启动界面
 - DMD 电源和复位驱动器控制
 - 基于闪存的可编程配置
- 测试支持
 - 内置测试图形发生器
 - JTAG：支持边界扫描
- 采用 216 引脚 1.0mm 间距 BGA 封装

2 应用

- 宽视场和增强现实抬头显示 (HUD)
- 车内投影显示和照明
- 数字仪表组、导航和信息娱乐系统挡风玻璃显示
- 汽车小灯
- 动态地面投影

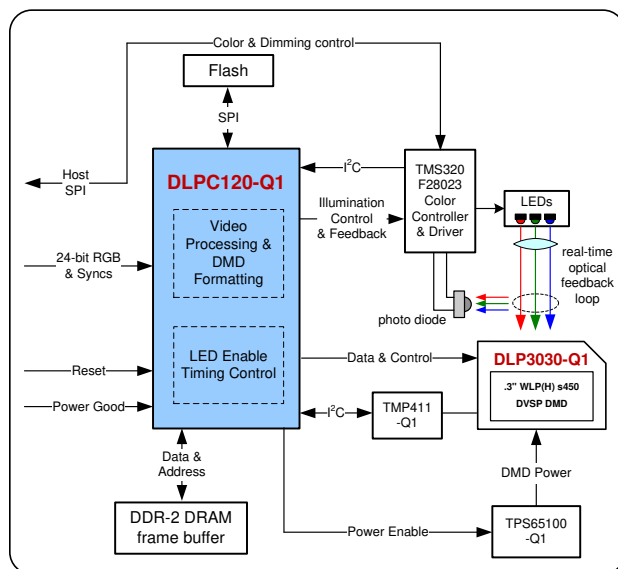

3 说明

DLPC120-Q1 适用于汽车应用的 DMD 显示控制器是与三个数字微镜器件 (DMD) 之一 (DLP3030-Q1、DLP3020-Q1 或 DLP3021-Q1) 兼容的芯片组的一部分。DLPC120-Q1 的核心逻辑负责接受视频输入并对数据进行格式化以便在 DMD 上显示，同时还控制 RGB LED 来形成实时图像。DLPC120-Q1 还负责根据外部系统控制或 DMD 温度输入来控制 DMD 的上电和断电事件。通过与外部调光电路和微控制器结合，DLPC120-Q1 支持的宽调光范围 > 5000:1，适合于 HUD 应用。通常情况下，DLPC120-Q1 是主机处理器 I²C 接口的外围器件。

表 5-1. DLPC120-Q1 Device Initialization and Programming Pin Descriptions

PIN		I/O	I/O	CLOCK	
NAME	NO.	POWER	TYPE	SYSTEM	DESCRIPTION
RESETZ	H13	3.30 V	I ₂	Async	Functional Reset (Active Low). Resets internal logic and causes PLL startup and PLL locking. Assertion is required after power supplies are within limits. See 节 6.7 for timing requirements.
PWRGOOD	G13		I ₂	Async	System Power Good indicator. Should be held low until all DLPC120-Q1 power has been within operating limits. See 节 6.7 for timing requirements. Must be set high to enable normal operation. When set low, the DLPC120-Q1 begins the parking routine for the DMD. Together with pin E14 (LED_R_PWM / PWRGOOD_CNTRL), this signal is critical for DLP30xx-Q1 parking as part of the Pre-Conditioning Sequence and subsequent un-parking. See <i>DLPC120-Q1 Programmer's Guide</i> for implementation details.
PLL_REFCLK_I	G15		I ₂	N/A	Reference Clock Input (16 MHz). Can be driven by crystal across this pin and PLL_REFCLK_O or by external oscillator. See 节 6.7 for timing requirements.
PLL_REFCLK_O	G14		O ₆	N/A	Crystal output. Used with PLL_REFCLK_I.
HUD_INTR	A14		O ₆	N/A	Interrupt signal. This active high signal indicates one of the interrupt sources in the controller has been triggered.
IIC_SCL_1	P16		B ₈	N/A	I ² C Clock for Device configuration and control. Requires external pull-up. Port 1 peripheral command/control interface.
IIC_SDA_1	N15		B ₈	N/A	I ² C Data for Device configuration and control. Requires external pull-up. Port 1 peripheral command/control interface.
IIC_SCL_2	M15		B ₈	N/A	I ² C Clock Debug Port. Requires external pull-up. Port 2 peripheral command/control interface.
IIC_SDA_2	N16		B ₈	N/A	I ² C Data Debug Port. Requires external pull-up. Port 2 peripheral command/control interface.
FLASH_POCI	F14		I ₂	FLASH_SCLK	Serial Data input from the external SPI Flash device. This provides device logical programming data as well as functional configuration parameter data.
FLASH_CSZ	F15		O ₆	FLASH_SCLK	Chip Select output for the external SPI Flash device. Active low.
FLASH_SCLK	E16		O ₆	N/A	Clock for the external SPI Flash device.
FLASH_PICO	E15		O ₆	FLASH_SCLK	Serial Data output to the external SPI Flash device. This pin sends address and control information as well as data when programming.

5.1 LED Driver Interface

PIN		I/O	I/O	CLOCK	DESCRIPTION
NAME	NO.	POWER	TYPE	SYSTEM	
LED_B_PWM	D16	3.30 V	O ₆	N/A	Function reserved for future use.
LED_R_PWM (PWRGOOD_CNTRL)	E14		O ₆	N/A	Repurposed for power good control. Together with pin G13 (PWRGOOD), this signal is used for DLP30xx-Q1 parking as part of the preconditioning sequence and subsequent unparking. See the <i>DLPC120-Q1 Programmer's Guide</i> for implementation details.
LED_G_PWM	F13		O ₆	N/A	Function reserved for future use.
LED_B_EN	C15		O ₆	N/A	Blue LED enable strobe. Controlled by programmable DMD sequence timing (active high)
LED_R_EN	C16		O ₆	N/A	Red LED enable strobe. Controlled by programmable DMD sequence timing (active high)
LED_G_EN	D14		O ₆	N/A	Green LED enable strobe. Controlled by programmable DMD sequence timing (active high)
LED_S_EN	B16		O ₆	N/A	LED shunt enable. Controlled by programmable DMD sequence timing (active high)
LED_D_EN	E13		O ₆	N/A	LED drive enable. Controlled by programmable DMD sequence timing (active high)
LEDDRV_ON	D15		O ₆	Async	LED driver enable. Active high output control to external LED drive logic
LED_EN	F16		I ₂	Async	LED enable (active high input). A logic low on this signal forces LEDDRV_ON low and RGB strobes low. These signals are enabled 100 ms after LED_EN transitions to a high (assuming corresponding SW parameters are also set to enable LED operation).
LED_COMPZ	D13		I ₂	Async	LED threshold compare (active low input). A logic low on this signal indicates a threshold is reached, and in discontinuous mode controls shunt enable (LED_S_EN).
AST_CLR0	L12		O ₆	N/A	Function reserved for future use
AST_HLD0	M13		O ₆	N/A	Function reserved for future use
AST_INTR0	L13		O ₆	N/A	Sequence timer interrupt port
AST_CLR1	M12		O ₆	N/A	Function reserved for future use
AST_HLD1	R16		O ₆	N/A	Function reserved for future use
AST_INTR1	M14		O ₆	N/A	Function reserved for future use

5.2 DMD Temperature Interface

PIN		I/O	I/O	CLOCK	DESCRIPTION
NAME	NO.	POWER	TYPE	SYSTEM	
TMP_SDA	K13	3.30 V	B ₈	Async	Temperature control serial data. This signal is used to communicate with the TMP411 to read the temperature values. Follows I ² C protocol as required by TMP411.
TMP_SCL	M16		B ₈	Async	Temperature control serial clock. This signal is used to communicate with the TMP411 to read the temperature values. Follows I ² C protocol as required by TMP411.
HTR_ENABLE	C14		O ₆	Async	Reserved pin

General Purpose I/O

PIN		I/O	I/O	CLOCK	
NAME	NO.	POWER	TYPE	SYSTEM	DESCRIPTION
AUXBIT_0 (FLICKER_SELECT)	C13	3.30 V	O ₆	Async	This pin is configured by default to be asserted at the lowest brightness mode to activate flicker reduction logic in the LED driver circuit. It is deasserted, otherwise, to deactivate the flicker reduction logic for normal operation. Contact a TI Applications Engineer for implementation details.
AUXBIT_1	B14		O ₆	Async	DMD sequencer reset AUX Bit 1. Intended for system debug. Can be routed to a testpoint or left unconnected
AUXBIT_2	A15		O ₆	Async	DMD sequencer reset AUX Bit 2. Intended for system debug. Can be routed to a testpoint or left unconnected
AUXBIT_6	D11		O ₆	Async	DMD sequencer reset AUX Bit 6. Intended for system debug. Can be routed to a testpoint or left unconnected
AUXBIT_7	B13		O ₆	Async	DMD sequencer reset AUX Bit 7. Intended for system debug. Can be routed to a testpoint or left unconnected

5.3 Main Video and Data Control Interface

PIN		I/O	I/O	CLOCK

PDATA[21]	N13	I ₂			
PDATA[22]	P14	I ₂			
PDATA[23]	P15	I ₂			

(1) Pixel clock capture edge is software programmable.

- (2) VSYNC, HSYNC, and data valid polarity are software programmable.
- (3) The 24-bit PDATA bus can be mapped based on pixel format. By default PDATA[23-16]=Red[7-0], PDATA[15-8]=Green[7-0], and PDATA[7-0]=Blue[7-0]. See the *DLPC120-Q1 Programmer's Guide* for more information.

5.4 DMD Interface

PIN		I/O	I/O	CLOCK	
NAME	NO.	POWER	TYPE	SYSTEM	DESCRIPTION
DMD_D0	B12	1.80 V	O ₅	DMD_DCLK	DMD data pins. DMD data pins are DDR (Double Data Rate) signals that are clocked on both edges of DMD_DCLK.
DMD_D1	A13				
DMD_D2	A12				
DMD_D3	B11				
DMD_D4	C10				
DMD_D5	A11				
DMD_D6	D9				
DMD_D7	B10				
DMD_D8	A10				
DMD_D9	B9				
DMD_D10	A9				
DMD_D11	A8				
DMD_D12	B8				
DMD_D13	C8				
DMD_D14	A7				
DMD_DCLK	A6		O ₅	N/A	DMD data clock (DDR)
DMD_LOADB	C7		O ₅	DMD_DCLK	DMD data load signal (active low)
DMD_SCTRL	B6		O ₅	DMD_DCLK	DMD data serial control signal
DMD_TRC	B7		O ₅	DMD_DCLK	DMD data toggle rate control
DMD_DAD_OEZ	A5		O ₅	Async	DMD DAD output enable (active low). A pullup (10 k Ω to 100 k Ω) to the 1.8-V rail for the DMD interface is needed to keep this signal inactive when tristated.
DMD_DAD_BUS	B5		O ₅	DMD_SAC_CLK	DMD DAD bus data
DMD_DAD_STRB	D7		O ₅	DMD_DCLK	DMD DAD bus strobe.
DMD_SAC_BUS	A4		O ₅	DMD_SAC_CLK	DMD SAC bus data
DMD_SAC_CLK	A3		O ₅	N/A	DMD SAC bus clock
DMD_JTCK	B4	O ₄	N/A	DMD interface test clock. Signal connected to DMD JTAG interface to allow the verification of the interface. The interface is tristated when not active.	
DMD_JTMS	C5	O ₄	N/A	DMD interface test mode. Signal connected to DMD JTAG interface to allow the verification of the interface. The interface is tristated when not active.	
DMD_JTDI	D5	O ₄	N/A	DMD interface test data output. Signal connected to DMD JTAG interface to allow the verification of the interface. This signal connects to the DMD JTAG TDI. The interface is tristated when not active.	
DMD_JTDO	C4	I ₁	N/A	DMD interface test data input. Signal connected to DMD JTAG interface to allow the verification of the interface. This signal connects to the DMD JTAG TDO. Internal pulldown.	
DMD_PWR_EN	C11	3.30 V	O ₆	Async	DMD power regulator enable (active high)

5.5 Memory Interface

PIN		I/O	I/O	CLOCK	
NAME	NO.	POWER	TYPE	SYSTEM	DESCRIPTION

Board Level Test and Debug

PIN		I/O	I/O	CLOCK	
NAME	NO.	POWER	TYPE	SYSTEM	DESCRIPTION
JTAGRSTZ	J13	3.30 V	I ₂	Async	JTAG, Reset. Includes weak internal pull-up. Holds TAP controller and associated JTAG logic in idle state under normal operation. This pin should be pulled down with a 5 kΩ or smaller resistor for normal operation.
JTAGTDI	K15		I ₂	JTAGTCK	JTAG, Serial Data In. Includes weak internal pull-up.
JTAGTCK	L15		I ₂	N/A	JTAG, Serial Data Clock. Includes weak internal pull-up.
JTAGTMS	L16		I ₂	JTAGTCK	JTAG, Test Mode Select. Includes weak internal pull-up.
JTAGTDO	K14		O ₆	JTAGTCK	JTAG, Serial Data Out.

Manufacturing Test Support

PIN		I/O	I/O	CLOCK	
NAME	NO.	POWER	TYPE	SYSTEM	DESCRIPTION
HWTEST_EN	G16	3.30 V	I ₂	N/A	Manufacturing Test Enable signal. Should be connected directly to ground on the PCB for normal operation. Weak Internal Pulldown.
MEM_ATO	K3	N/A	O	N/A	Memory Controller Analog Test Output. Factory Test purposes only, should be left unconnected in system.
MEM_DTO0	M4	3.30 V	O _s	N/A	Memory Controller Digital Test Output #1. Factory Test purposes only, should be left unconnected in system.
MEM_DTO1	N4	3.30 V	O _s	N/A	Memory Controller Digital Test Output #2. Factory Test purposes only, should be left unconnected in system.

Test Point Interface

PIN		I/O	I/O	CLOCK	
NAME	NO.	POWER	TYPE	SYSTEM	DESCRIPTION
TSTPT_0	K16	3.30 V	B ₈	Async	Reserved for Test Outputs. These test I/O should be left open or unconnected for normal operation in final product design. (DO NOT tie to GND), Internal Pullup on all signals. TSTPT_4 should be pulled up using external 10 kΩ resistor to ensure proper initialization.

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

(2) All voltage values are with respect to GND.

6.2 ESD Ratings

		VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	
		Charged-device model (CDM), per AEC Q100-011	All pins	±500
			Corner pins (A1, A16, T1, and T16)	±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.7 Power Supply and Reset Timing Requirements

		MIN	MAX	UNIT
t _{ramp}	Time for all DLPC120-Q1 power rails to be applied	Power supplies can be applied in any order if they occur within this maximum timing. Otherwise, refer to Note ⁽¹⁾ .		10 ms
t _{pwr_en}	RESETZ rising edge (or PWRGOOD rising edge—whichever comes second) to DMD_PWR_EN rising edge	PWRGOOD shall be controlled by LED_R_PWM / PWRGOOD_CNTRL signal, which is an output of the DLPC120-Q1 and will automatically be asserted after the device releases from reset.		150 μs

6.7 Power Supply and Reset Timing Requirements (continued)

		MIN	MAX	UNIT
t_{dly}	External delay between DMD_PWR_EN and DMD mirror supply voltages	This delay is not required for supported devices.		ms
t_{oez}	DMD_PWR_EN rising edge to falling edge of DMD_OEZ		5	ms
$t_{precondition}$	DMD preconditioning time ¹	It is required that the DMD executes a Pre-Conditioning Sequence prior to parking. The final action of this sequence is the de-assertion of the LED_R_PWM / PWRGOOD_CNTRL signal, which shall drive the PWRGOOD signal low. See the <i>DLPC120-Q1 Programmer's Guide</i> for instructions on how to execute the Pre-Conditioning Sequence.		800 μ s
t_{park}	DMD park time (approximate)	200	200	μ s
t_{pd_dmd}	PWRGOOD low to falling edge of DMD_PWR_EN		500	μ s
t_{fall}	Time for DLPC120-Q1 power supplies to be removed	Power supplies can be removed in any order if they occur within this maximum timing. Otherwise, they shall be removed in the reverse order they were applied, per the t_{ramp} specification and Note ⁽¹⁾ .		10 ms

- (1) If the DLPC120-Q1 supplies cannot be applied according to this timing specification, then they must be applied in the following order, spanning no longer than 100 ms (shall be removed in the reverse order for power down):
- Apply VCCIO_2 (3.3 V)
 - Apply VCCIO_0, VCCIO_1 (1.8 V) DDR Memory and DMD, in any order
 - Apply VDD (1.2 V) DLPC120-Q1 core supply voltage

t_{buf}	Bus free time between stop and start conditions	1.3		μ s
t_{sts}	Start or repeated start condition setup	0.6		μ s
t_{sth}	Start or repeated start condition hold	0.6		μ s
t_{sph}	Stop condition hold	0.6		μ s

- (1) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (2) The maximum t_{HD_DAT} has only to be met if the device does not stretch the LOW period (t_{LOW}) of the SCL signal.
- (3) A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement t_{SU_DAT} 250 ns must then be met. This is automatically the case since the device does not stretch the LOW period of the SCL signal.
- (4) C_b = total capacitance of one bus line in pF.

7.2 Design for Test Functions

The DLPC120-Q1 has several built-in test features. These tests can be run to verify ASIC functionality on startup or during normal operation. Refer to *DLPC120-Q1 Programmer's Guide* for more detail regarding test usage. [表 7-2](#) defines the execution time of each test.

表 7-2. Test Execution Times

TEST NAME	LENGTH (ms)	SUMMARY
DDR2 BIST (Short)	145	The Short DDR2 BIST implements a memory check using a March13 Algorithm to verify the external DDR2 SDRAM frame buffer space. It runs at power-up or also can be executed on demand, but it is recommended to run only at power-up, since the image will flash if executed on demand. The short version runs a portion of the long test.
DDR2 BIST (Long)	470	The Long DDR2 BIST is the same as the Short DDR2 BIST, but it runs the test multiple times.
FLASH BIST (1 MByte)	215	The Flash BIST calculates configuration memory checksum (32 bits) for data integrity of the Flash data and interface. Flash checksum is recommended to be done at power-up to verify configuration settings. The Flash BIST memory range to perform checksum is programmable to up to 32M.
System BIST ⁽²⁾	See ⁽¹⁾	The System BIST validates the DLPC120-Q1 internal logic. It sends a known test pattern image through the ASIC to verify the checksum at the last stage before the data reaches the DMD. When enabled, the checksum for each frame of data is calculated and stored in an I ² C register.

表 7-2. Test Execution Times (continued)

TEST NAME	LENGTH (ms)	SUMMARY
DMD Interface Test	6.93	The DMD JTAG BIST validates the connection between the ASIC and DMD. It uses the DMD JTAG interface to sample the ASIC pins and compare against expected values, and it also tries to detect shorts between signals. The BIST is run on demand.
Front End Video Checksum	See ⁽¹⁾	The Front End Video Checksum is used to verify that the video is received correctly at the front end on the specified region of the frame. When enabled, it calculates the checksum for the specified region of the video frame and stored in an I ² C register.
Video Detect Test	See ⁽¹⁾	The Video Detect test shall be used to monitor external video VSYNC. If external video is not valid, the DMD must be put into a safe state (e.g. switched to an internal black test pattern).

(1) The length of these tests will vary depending on frame rate but will not exceed 2 frames.

(2) Some processing options must be turned off for this test.

8 Detailed Description

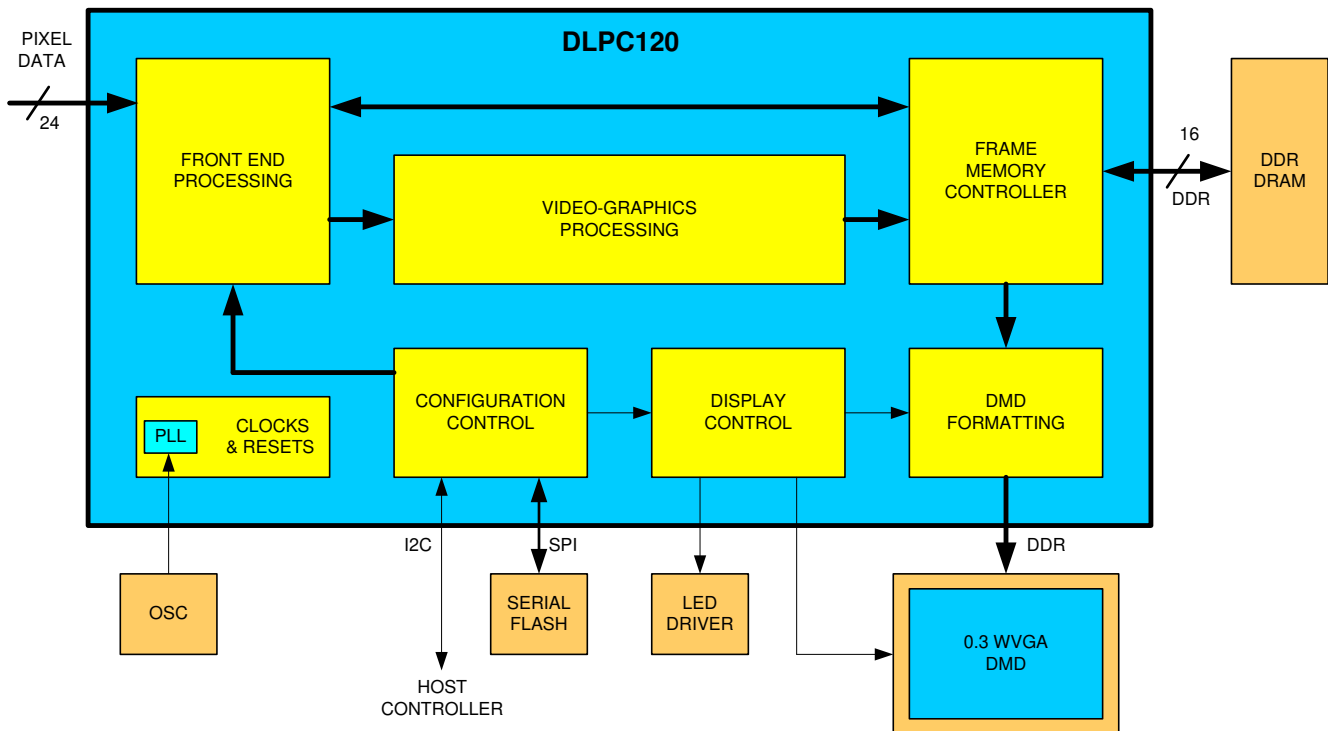

8.1 Overview

The DLPC120-Q1 is compatible with three DMD components:

- DLP3030-Q1 - 0.3 WVGA S450 DMD
- DLP3020-Q1 - 0.3 WVGA FQR DMD
- DLP3021-Q1 - 0.3 WVGA FQR DMD

The DLPC120-Q1 formats incoming video data from a parallel interface and drives the DMD timing to display the video. It also controls illumination enables to strobe illuminators synchronously with the DMD mirror movement. The DLPC120-Q1 is designed for automotive applications with a wide operating temperature range and diagnostic features to identify certain failure modes.

图 8-1. Functional Block Diagram

8.3 Feature Description

8.3.1 Serial Flash Interface

The DLPC120-Q1 utilizes an external SPI serial flash memory device for configuration support. The minimum required size is dependent on the desired minimum number of Sequences, CMT tables, and Splash options, while the maximum supported size is 64 Mb. The DLPC120-Q1 can be used to Read, Erase, and program the serial flash. Refer to *DLPC120-Q1 Programmer's Guide* for details of Flash configuration information.

The DLPC120-Q1 utilizes a single SPI interface, employing SPI mode 0 protocol, operating at a frequency of 39.0 MHz. All read operations assume the Flash supports address auto-incrementing. The DLPC120-Q1 should support any flash device that meets these criteria plus the criteria listed in [表 8-1](#).

表 8-1. SPI Flash Instruction Op Code Compatibility Requirements

FLASH COMMAND	OPCODE
Fast Read (Single Output)	0x0B
Read Electronic Signature	0xAB
Others	May vary

The DLPC120-Q1 does not have any specific Page, Block or Sector size requirements. If the user would like to use a portion of the serial flash for storing external data (such as calibration data) via the I²C interface, then the minimum sector size needs to be considered as it will drive minimum erase size. Note that use of serial flash for storing external data may impact the number of features that can be supported.

The DLPC120-Q1 does not drive the /HOLD (active low Hold) or /WP (active low Write Protect) pins on the flash device and thus these pins should be tied to a logic high on the PCB via an external pull-up.

表 8-2. DLPC120-Q1 Compatible SPI Flash Device Options

VENDOR	PART NUMBER	DENSITY (Mb)	SUPPLY VOLTAGE SUPPORTED ⁽¹⁾
ISSI	IS25LP064A-JMLE	64	3.3 V
Winbond	W25Q64CVSFAG	64	3.3 V
Spansion	S25FL064P0XMFV000	64	3.3 V
Micron	M25P64-VMF3TPB	64	3.3 V

(1) The Flash supply voltage must match VCCIO_2 on the DLPC120-Q1. Multiple voltage options are often available under the same base part number.

8.3.2 Serial Flash Programming

The external serial flash may also be programmed via the same SPI interface which is connected to the DLPC120-Q1. In order to avoid conflicting data on this interface, the DLPC120-Q1 must be held in reset while the flash memory is programmed. See flash specification for details of the programming configuration.

8.3.3 DDR2 Memory Interface

The DLPC120-Q1 ASIC DDR2 Memory interface consists of a 16-bit wide, 312-MHz (nominal) DDR2 interface with standard signaling. The DLPC120-Q1 only support DDR2 interface with external termination. The DDR2 interface is a very high speed signaling interface.

A DDR2 memory should be selected that supports the 312-MHz clock frequency and compliant to the JEDEC standard for DDR2 memories (JESD79-2A).

8.3.4 JTAG and DMD Interface Test

The DLPC120-Q1 has two test interfaces using JTAG protocol:

- A standard JTAG (IEEE-1149) function of the ASIC is provided. The TI-provided BSDL file contains the details of the DLPC120-Q1 boundary scan chain. This JTAG interface is provided to enable system level validation of proper assembly of the DLPC120-Q1 onto a PCB.
- The DLPC120-Q1's DMD interface is designed to be the controller for an in-system DMD interface test. The DMD interface should be connected directly to the DMD's JTAG pins. This interface is exclusively designed and verified to support the DLP3030-Q1, DLP3020-Q1 and DLP3021-Q1.

图 8-2. JTAG and DMD Interface Test

Using the DMD JTAG function, the DMD interface signals are toggled, and the connection at the DMD is verified by using the DMD JTAG signals to sample the inputs, and then toggled back to the DLPC120-Q1 for comparison to expected values. All DMD logic signals, except DAD OEZ, are tested individually for stuck high or low independently. Alternating data pattern for adjacent pins, as well as "walking 1" s" and "walking 0" s" patterns are used during the test. The DAD_OEZ is only tested in the high state as asserting this signal and toggling the inputs could cause damage to the DMD. Refer to 图 8-3 for recommended connections for the DLPC120-Q1

boundary scan test configuration. Refer to 图 8-4 for recommended connections of the DLPC120-Q1 to DMD interface test. For additional information about the DMD Boundary scan function refer to the specific DMD device datasheet.

8.3.5 Temperature Monitor Function

The DLPC120-Q1 connects with the TMP411 through a standard I²C bus protocol using the TMP_SDA and TMP_SCL pins. The internal temperature controller initializes the TMP411 to read the temperature of the DMD.

The TMP controller issues a set of read commands at eight times per second through the I²C interface to read the remote temperature (DMD) and local temperature from the TMP411.

The TMP411 monitors the DMD temperature and controls the DMD park operation when the DMD is operated beyond the required specification. See the *DLP3030-Q1*, *DLP3020-Q1* and *DLP3021-Q1 Data Sheet* for the DMD operating temperature. If the DMD park operation is used, then a 1-degree hysteresis is applied. See the *DLPC120-Q1 Programmer's Guide* for description of this function.

8.3.6 Host Command Interface

The DLPC120-Q1 provides two I²C interface port for host commands. Only one of these ports is intended to be used at a time. The unused port is meant for system debug or development purposes. The I²C protocol and register definitions are defined in the *DLPC120-Q1 Programmer's Guide*.

8.4 Device Functional Modes

The DLPC120-Q1 has three operational display modes, which are selected with command list execution via the Host control interface. These display modes are External Video, Splash Screen, and Test Pattern.

8.4.1 External Video Mode

Upon the release of reset and initialization, the DLPC120-Q1 will automatically enter in External Video mode. This mode will process the video source on the parallel RGB input interface at a given resolution and frame rate. The system supports multiple input video resolutions, and the resolution expected by the DLPC120-Q1 can be configured via command list execution. See [表 7-1](#) for the different external video resolutions supported by the system.

8.4.2 Splash Screen Mode

This mode displays a custom, static image, which is stored in the DLPC120-Q1 Application Serial Flash memory. The content of the splash image is configurable. The Flash memory can store multiple Splash Screens, where the quantity is limited by the size of the splash images, size of the memory chip, and capacity of the remaining memory contents. Splash Screens are displayed via command list execution. Contact a TI Applications Engineer in order to change the splash images stored in the Flash memory.

8.4.3 Test Pattern Mode

This mode displays a fixed, static image, which is stored in the DLPC120-Q1 Application Serial Flash memory. The content of the test patterns are pre-defined, limited by the design of the DLPC120-Q1. Test Patterns are displayed via command list execution. See *DLPC120-Q1 Programmer's Guide* for a list and image of the supported Test Patterns.

9 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DLPC120-Q1 is a DLP display processor that supports automotive head-up display (HUD) applications. It accepts data from a variety of video input resolutions and provides the digital image processing and control necessary to drive an LED based DLP display system. This document reflects the operation, pinout, and timing associated with the DLPC120-Q1 device only.

The DLPC120-Q1 is compatible with three DMD components:

- DLP3030-Q1 - 0.3 WVGA S-450 DMD
- DLP3020-Q1 - 0.3 WVGA FQR DMD
- DLP3021-Q1 - 0.3 WVGA FQR DMD

9.2 Typical Application

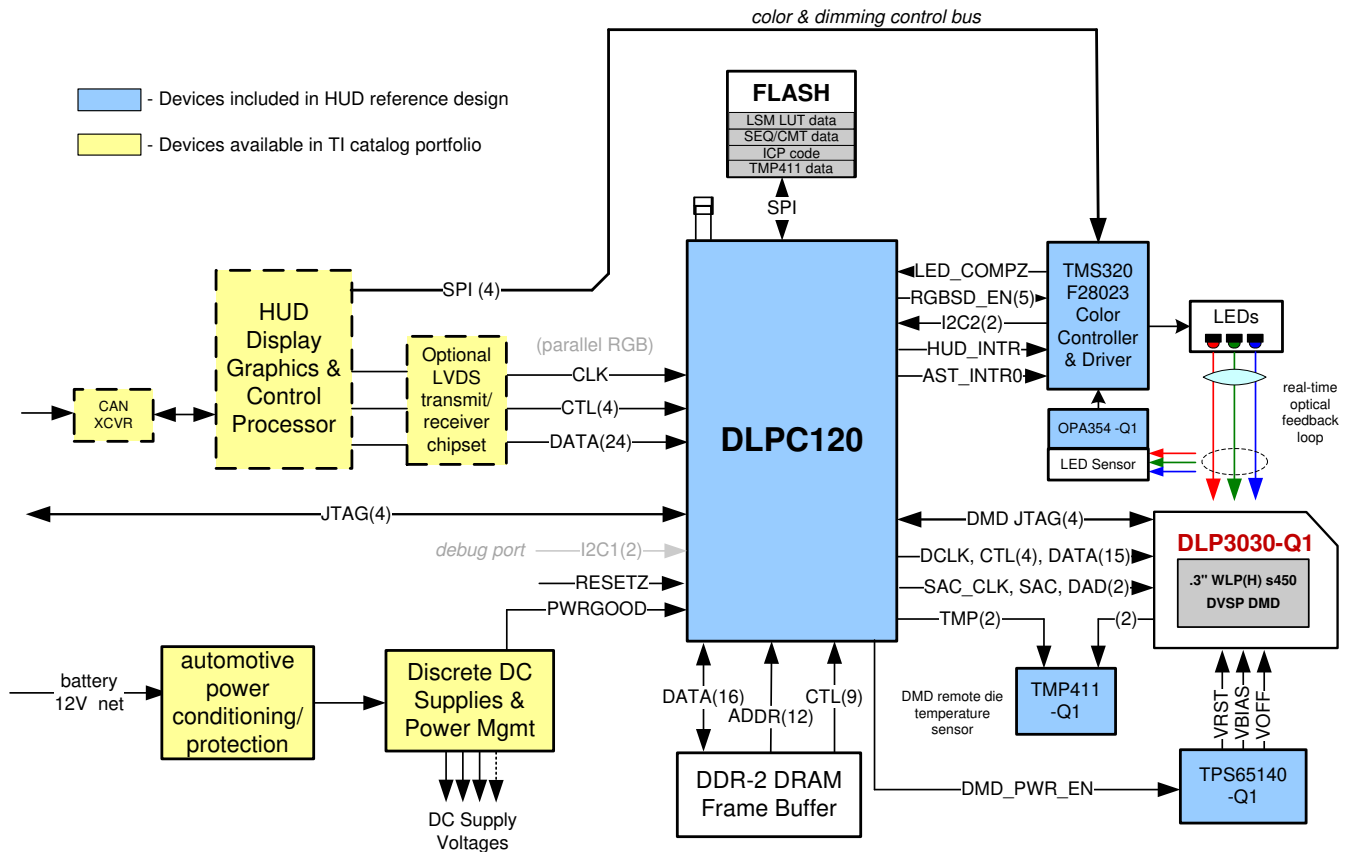

图 9-1. DLPC120-Q1 System Block Diagram

9.2.1 Design Requirements

The 图 9-1 shows a typical projector application. For this application, the DLPC120-Q1 is controlled by a separate control processor, and the image data is received through the parallel RGB interface.

As with prior DLP® electronics solutions, image data is 100% digital from the DLPC120-Q1 input port to the image projected on to the display screen. The image stays in digital form and is never converted into an analog signal. The DLPC120-Q1 processes the digital input image and converts the data into a bit-plane format, as needed by the DMD. The DMD then reflects light to the screen using binary pulse-width-modulation (PWM) for each pixel mirror. The viewer's eyes integrate this light to form brilliant, crisp images.

The DLPC120-Q1 provides signals that enable red, green, and blue LEDs to synchronize to the DMD PWM bit planes. These signals combined with an external MCU (TMS320F28023) can be used to create a very high dynamic dimming range necessary for automotive heads-up display (HUD) applications.

The DLPC120-Q1 also features temperature monitoring of the DMD in order to automatically park the micromirrors when the DMD temperature is beyond the operating range.

The DLPC120-Q1 uses the DDR2 SDRAM as a frame buffer to convert RGB video data into the necessary bit plane format required by the DMD. The DLPC120-Q1 also supports multiple input resolutions and scales them to match the native .3" WVGA DMD format. These images can also be electronically bezel-adjusted on the DMD, which could allow the displayed image to be electronically adjusted for mechanical misalignment. The DLPC120-Q1 is configured at power up with data stored in the Flash memory via SPI. The Flash interface is the primary method to configure the controller.

The DLPC120-Q1 supports system diagnostic and self-check features, such as video detection, DDR2 memory Built-in Self Test (BIST), System BIST, Flash BIST, and JTAG (in system and DMD interface).

Due to the mechanical nature of the micromirrors, the latency of the DMD and DLPC120-Q1 chipset is fixed across all temperature and operating conditions. The observed video latency is one frame, or 16.67 ms at an input frame rate of 60 Hz. However, please note that the use of the DLPC120-Q1 bezel adjustment feature, if enabled, requires an additional frame of processing.

The capacitors should be mounted as close to the package balls as possible.

11.1.2 DLPC120-Q1 Reference Clock

The DLPC120-Q1 requires an external reference clock to feed its internal PLL. A crystal or oscillator can supply this reference. The recommended crystal configurations and reference clock frequencies are listed in 表 11-3, with additional required discrete components shown in 图 11-2 and defined in 表 11-3.

- A. C_L = Crystal load capacitance
- B. R_{FB} = Feedback Resistor

图 11-2. Discrete Components Required When Using Crystal

11.1.2.1 Recommended Crystal Oscillator Configuration

PCB layout	A ground isolation ring around the crystal is recommended	

- (1) $CL1 = 2 \times (CL - C_{stray_pll_refclk_i})$, where: $C_{stray_pll_refclk_i}$ = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin PLL_REFCLK_I. PLL_REFCLK_I device capacitance is approximately 3 pF.
- (2) $CL2 = 2 \times (CL - C_{stray_pll_refclk_o})$, where: $C_{stray_pll_refclk_o}$ = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin PLL_REFCLK_O. PLL_REFCLK_O device capacitance is approximately 3 pF.

11.1.3 General PCB Recommendations

TI provides PCB design files that serve as a reference for DLPC120-Q1 and DLP30xx-Q1 chipset PCB schematics and layout designs. Please contact a TI Applications Engineer to access these files.

11.1.4 PCB Routing Guidelines

All signals should follow a 0.005-in width 0.015-in spacing design rule. Minimum trace clearance from the ground ring around the PCB shall be 0.1-in minimum. Actual trace widths and clearances will be determined based on an analysis of impedance and stack-up requirements, some variation is expected.

GROUP	SIGNAL	CONSTRAINTS ⁽¹⁾
Serial Flash I/F	FLASH_DCLK, FLASH_POCI, FLASH_PICO, FLASH_CSZ	Lengths Matched to 100 mils Max Total Length: 2500 mils Impedance: 50 Ω (\pm 10%)

(1) Trace lengths on Layers 1 and 10 should be less than 50 mils.

11.1.5 Number of Layer Changes

- As a reference, the TI design uses no more than three layer changes per trace.
- Individual differentially matched signal pairs can be routed on different layers, but the signals of a given pair should not change.

11.1.6 Terminations

- All DMD I/F signals should be terminated at the source with a 20- Ω series resistor.
- MEM_CLK and MEM_CLKZ should be terminated with an external 100- Ω differential resistor across the two signals as close to the DRAM as possible. All other DDR2 control and data signals should be pulled to VTT(0.9 V) with a 56- Ω resistor as close to the DRAM as possible.

11.1.7 General Handling Guidelines for Unused CMOS-Type Pins

To avoid potentially damaging current caused by floating CMOS input-only pins, it is recommended that unused ASIC input pins be tied through a pull-up resistor to its associated power supply or a pull-down to ground. For ASIC inputs with an internal pull-up or pull-down resistors, it is unnecessary to add an external pullup or pulldown unless specifically recommended. Note that internal pull-up and pull-down resistors are weak and should not be expected to drive the external line. The DLPC120-Q1 implements very few internal resistors and these are noted in the pin list.

Unused output-only pins can be left open. When possible, it is recommended that unused Bi-directional I/O pins be configured to their output state such that the pin can be left open. If this control is not available and the pins may become an input, then they should be pulled-up (or down) using an appropriate resistor.

12.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
