3 说明

IWRL6432 毫米波传感器器件是一款基于 FMCW 雷达技术的集成式单芯片毫米波传感器。该器件能够在 57GHz 至 64GHz 频段内运行，主要分为四个电源域：

- **射频/模拟子系统**：该块包含发送和接收射频信号所需的所有射频和模拟元件。
- **前端控制器子系统 (FECSS)**：FECSS 包含负责雷达前端配置、控制和校准的处理器。
- **应用子系统 (APPSS)**：在 APPSS 中，该器件实现了一个用户可编程的 ARM Cortex M4，允许自定义控制和汽车接口应用。顶部子系统 (TOPSS) 是 APPSS 电源域的一部分，包含时钟和电源管理子块。
- **硬件加速器 (HWA)**：HWA 块通过卸载通用雷达处理（例如 FFT、恒定误报率 (CFAR)、缩放和压缩）来对 APPSS 进行补充。

IWRL6432 专为上述每个电源域配备单独的旋钮，可根据用例要求控制其状态（上电或断电）。该器件还具有运行各种低功耗状态（如睡眠和深度睡眠）的功能，其中低功耗睡眠模式是通过时钟门控和关闭器件的内部 IP 块来实现的。该器件还提供了保留器件某些内容的选项，例如在此类情况下保留的应用图像或射频配置文件。

此外，该器件采用 TI 的低功耗 45nm RF CMOS 工艺制造，以超小的外形尺寸实现了出色的集成度。IWRL6432 专为工业（和个人电子产品）领域的低功耗、自监控、超精确雷达系统而设计，适用于楼宇/工厂自动化、商业/住宅安全、个人电子产品、存在/运动检测以及用于人机界面的手势检测/识别等应用

- Topology 1: Autonomous mode, with ability to wake-up external MCU
- Topology 2: Peripheral mode, under control of external MCU

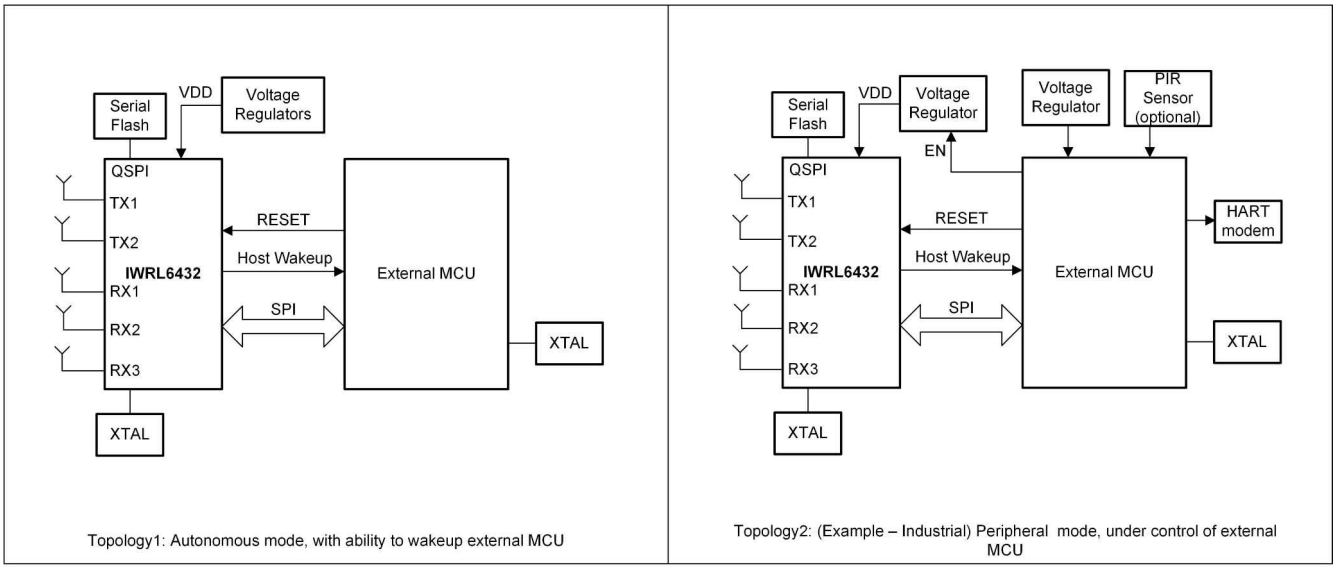

图 8-1. System Topologies

8.5.5.1 Power Topologies

The device supports two unique power topologies for BOM optimized and Power Optimized modes. Above tables summarizes these options.

8.5.5.1.1 BOM Optimized Mode

In this mode the device can be powered using one 1.8V regulator OR using a 3.3V and a 1.8V regulator mode. The choice of one rail vs two rails is dependent on the IO voltages needed.

8.5.5.1.2 Power Optimized Mode

This mode is for applications needing ultra-low power applications. The device can either be powered using two rails (1.8 V and 1.2 V) or with three rails (3.3 V, 1.8 V and 1.2 V).

8.5.6 Noise and Ripple Specifications

The 1.8-V power supply ripple specifications mentioned in 表 8-5 are defined to meet a target spur level of –105 dBc (RF Pin = –15 dBm) at the RX. The spur and ripple levels have a dB-to-dB relationship, for example, a 1-dB increase in supply ripple leads to a ~1 dB increase in spur level. Values quoted are peak-peak levels for a sinusoidal input applied at the specified frequency. These values are being optimized and are subject to change.

8.12.2 Synchronized Frame Triggering

The IWRL6432 device supports a hardware based mechanism to trigger radar frames. An external host can pulse the SYNC_IN signal to start radar frames. The typical time difference between the rising edge of the external pulse and the frame transmission on air (Tlag) is about 160 ns. There is also an additional programmable delay that the user can set to control the frame start time.

8.12.3 Input Clocks and Oscillators

8.12.3.1 Clock Specifications

The IWRL6432 requires external clock source (that is, a 40-MHz crystal or external oscillator to CLKP) for initial boot and as a reference for an internal APLL hosted in the device. An external crystal connected to the device pins 图 8-8 shows the crystal implementation.

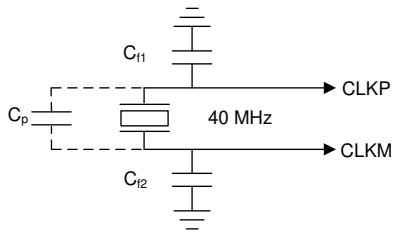

图 8-8. Crystal Implementation

备注

The load capacitors, C_{f1} and C_{f2} in 图 8-8, should be chosen such that 方程式 1 is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator CLKP and CLKM pins.

$$C_L = C_{f1} \times \frac{C_{f2}}{C_{f1} + C_{f2}} + C_P \quad (1)$$

表 8-12 lists the electrical characteristics of the clock crystal.

Frequency tolerance	Crystal frequency tolerance(1) (2) (3)	–200		200	ppm

(1) The crystal manufacturer's specification must satisfy this requirement.
(2) Includes initial tolerance of the crystal, drift over temperature, aging and frequency pulling due to incorrect load capacitance.
(3) Crystal tolerance affects radar sensor accuracy.

In the case where an external clock is used as the clock resource, the signal is fed to the CLKP pin only; CLKM is grounded. The phase noise requirement is very important when a 40-MHz clock is fed externally. 表 8-13 lists the electrical characteristics of the external clock signal.

The RDIF interface supports the following data rates(1):

- 400 Mbps
- 320 Mbps
- 200 Mbps

- The samples are sent one channel by one channel as shown in the diagram above. All the 12-bits of one channel are sent on 4 data lanes in 3 DDR_CLK edges, followed by next RX channel.
- The frame clock (FRM_CLK) spans 12 DDR_CLK edges and 48 bits are sent in 1 FRM_CLK
- The FRM_CLK can have gaps in between. This is required as the interface rate is greater than the incoming rate
- DDR_CLK is continuous.
- DDR_CLK is generated from 400MHz ADC CLK (one of the ADC CLKs) - selected for the DFE. It is the same 400MHz clock selected for DFE.
- New sample always starts at the rise edge of the DDR_CLK
- The FRM_CLK is valid for the entire data bit and is meets the Tsu/Th wrt DDR_CLK.

8.12.9.1 I2C Timing Requirements

		STANDARD MODE(1)		FAST MODE		UNIT
		MIN	MAX	MIN	MAX	
$t_{c(SCL)}$	Cycle time, SCL	10		2.5		µs
$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		µs
$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		µs
$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		µs
$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		µs

$t_{h(SCLL-SDA)}$	Hold time, SDA valid after SCL low	0	3.45(1)	0	0.9	µs
$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		µs
$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		µs
$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
C_b (2) (3)	Capacitive load for each bus line		400		400	pF

(1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
(2) The maximum $t_{h(SDA-SCLL)}$ for I2C bus devices has only to be met if the device does not stretch the low period ($t_{w(SCLL)}$) of the SCL signal.
(3) C_b = total capacitance of one bus line in pF. If mixed with fast-mode devices, faster fall-times are allowed.

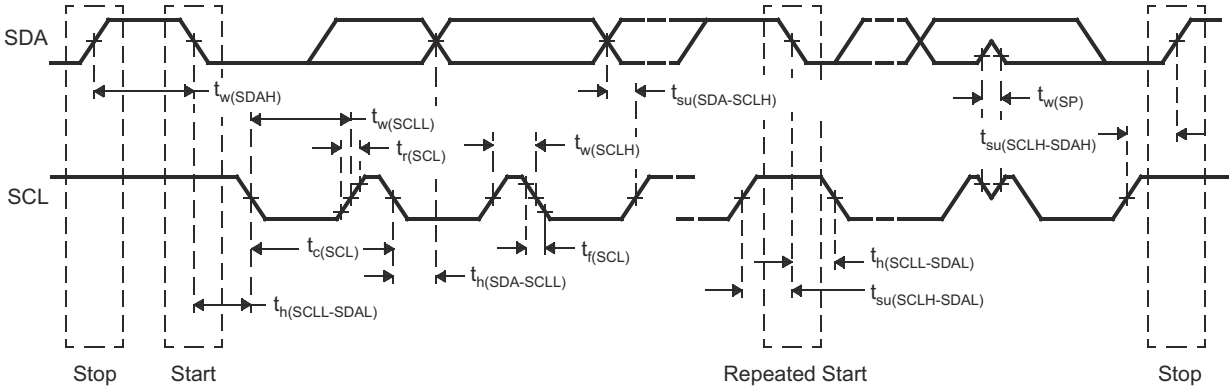

图 8-15. I2C Timing Diagram

备注

- A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the LOW period ($t_{w(SCLL)}$) of the SCL signal. E.A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{su(SDA-SCLH)} \geqslant 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line tr max + $t_{su(SDA-SCLH)}$.

9 Detailed Description

9.1 Overview

The IWRL6432 device is a complete SOC which include mmWave front end, customer programmable MCU and analog baseband signal chain for two transmitters and three receivers. This device is applicable as a radar-on-a-chip in use-cases with quality provision for memory, processing capacity and application code size. Use-cases include cost-effective industrial radar sensing applications. Examples are:

- Industrial-level sensing
- Industrial automation sensor fusion with radar
- Traffic intersection monitoring with radar
- Industrial radar-proximity monitoring
- People counting
- Gesturing

In terms of scalability, the IWRL6432 device could be paired with a low-end external MCU to address more complex applications that might require additional memory for a larger application software footprint and faster interfaces.

9.2 功能方框图

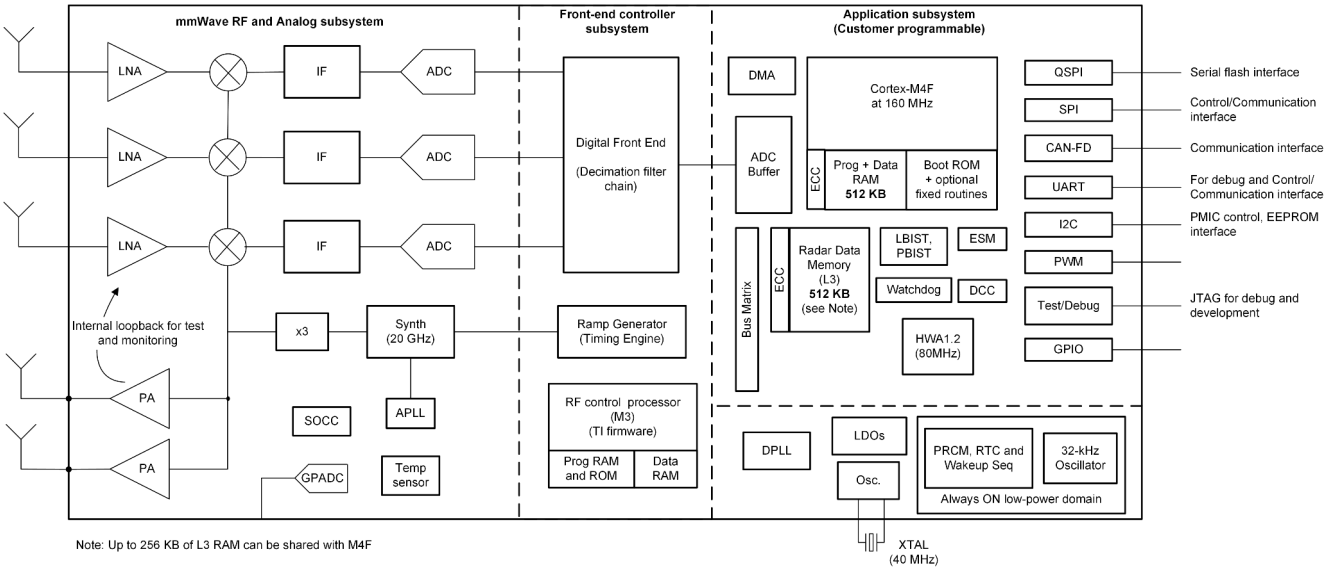

图 9-1. 功能方框图

9.3 Subsystems

9.3.1 RF and Analog Subsystem

The RF and analog subsystem includes the RF and analog circuitry – namely, the synthesizer, PA, LNA, mixer, IF, and ADC. This subsystem also includes the crystal oscillator and temperature sensors. The two TX can be operated simultaneously for beam forming in BPM mode or individually in TDM mode. Similarly, the device allows configuring the number of receive channels based on application and power requirements. For system power saving, RF and analog subsystems can be put into low power mode configuration.

9.3.2 Clock Subsystem

The IWRL6432 clock subsystem generates 57 to 64 GHz from an input reference from a crystal. It has a built-in oscillator circuit followed by a clean-up PLL and a RF synthesizer circuit. The output of the RF synthesizer is then processed by an X3 multiplier to create the required frequency in the 57 to 64 GHz spectrum. The RF synthesizer output is modulated by the timing engine block to create the required waveforms for effective sensor operation.

The clean-up PLL also provides a reference clock for the host processor after system wakeup.

The clock subsystem also has built-in mechanisms for detecting the presence of a crystal and monitoring the quality of the generated clock.

图 9-2 describes the clock subsystem.

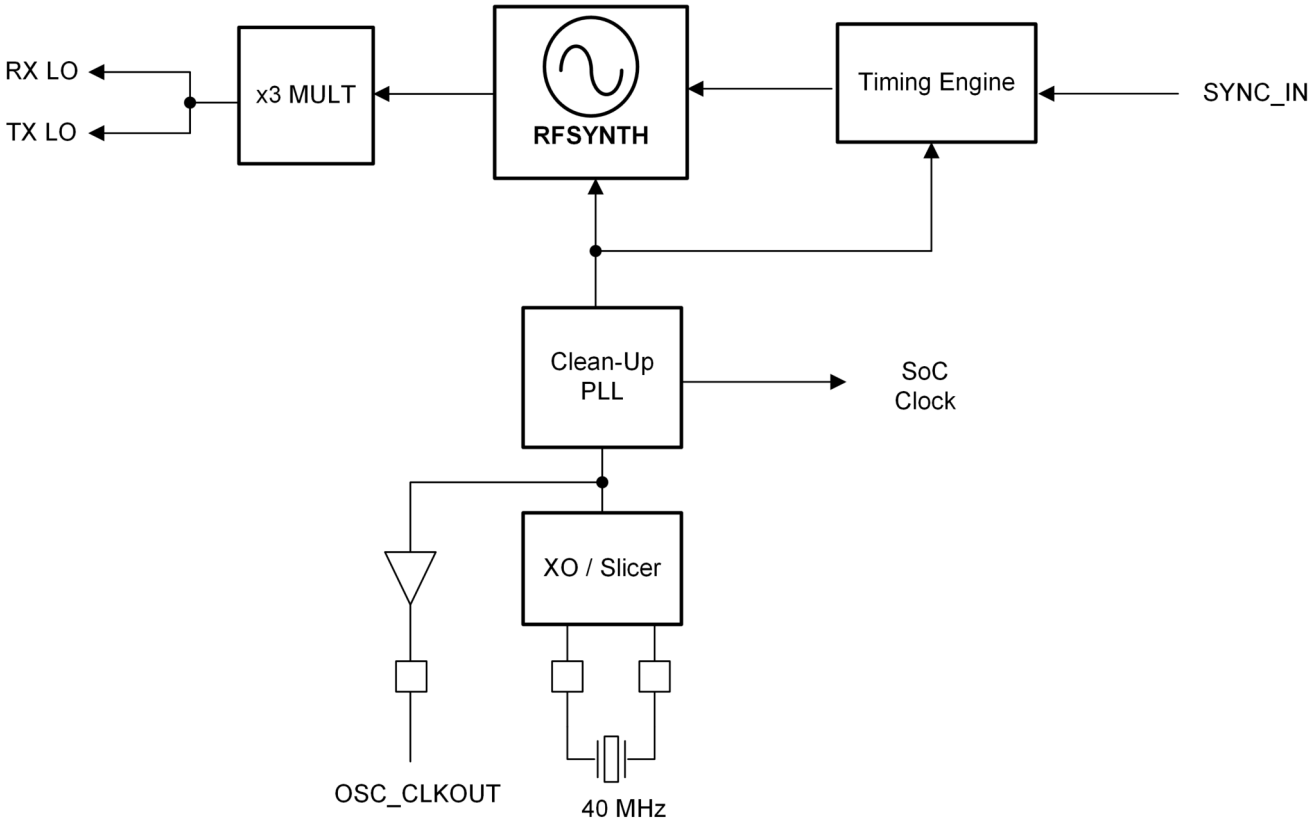

图 9-2. Clock Subsystem

9.3.3 Transmit Subsystem

The IWRL6432 transmit subsystem consists of two parallel transmit chains, each with independent phase and amplitude control. The device supports binary phase modulation for MIMO radar, TX Beam forming application, and interference mitigation.

The transmit chains also support programmable backoff for system optimization.

图 9-3 describes the transmit subsystem.

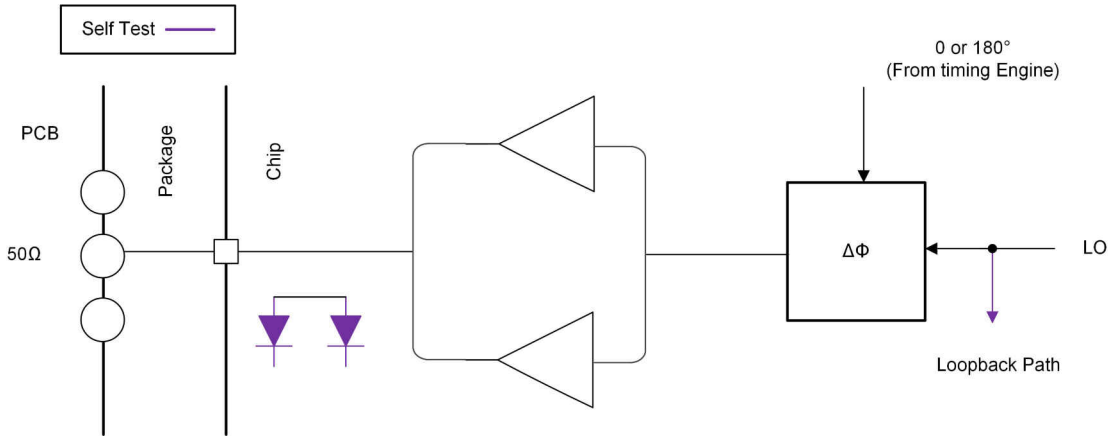

图 9-3. Transmit Subsystem (Per Channel)

9.3.4 Receive Subsystem

The IWRL6432 receive subsystem consists of three parallel channels. A single receive channel consists of an LNA, mixer, IF filtering, ADC conversion, and decimation. All three receive channels can either operate simultaneously OR can be powered down individually based on system power needs and application design.

The IWRL6432 device supports a real baseband architecture, which uses real mixer, single IF and ADC chains to provide output for each receiver channel. The device is targeted for fast chirp systems. The band-pass IF chain has configurable lower cutoff frequencies above 175 kHz and can support bandwidths up to 5 MHz.

图 9-4 describes the receive subsystem.

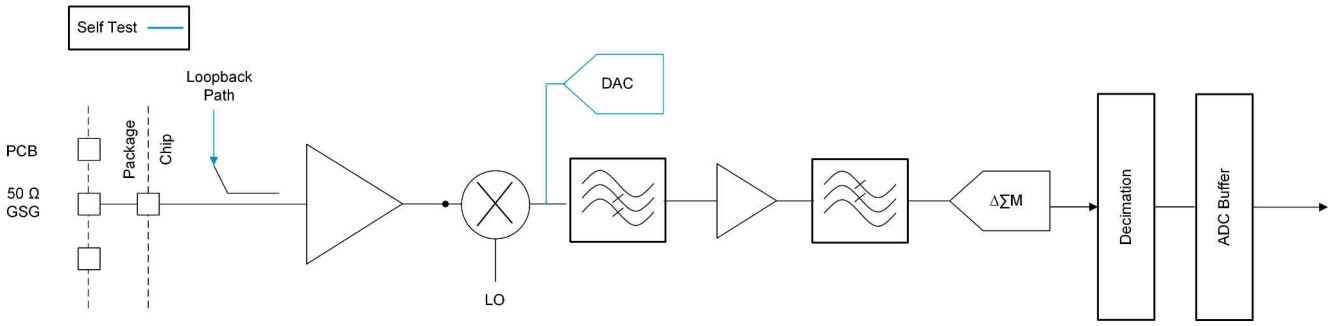

图 9-4. Receive Subsystem (Per Channel)

9.3.5 Processor Subsystem

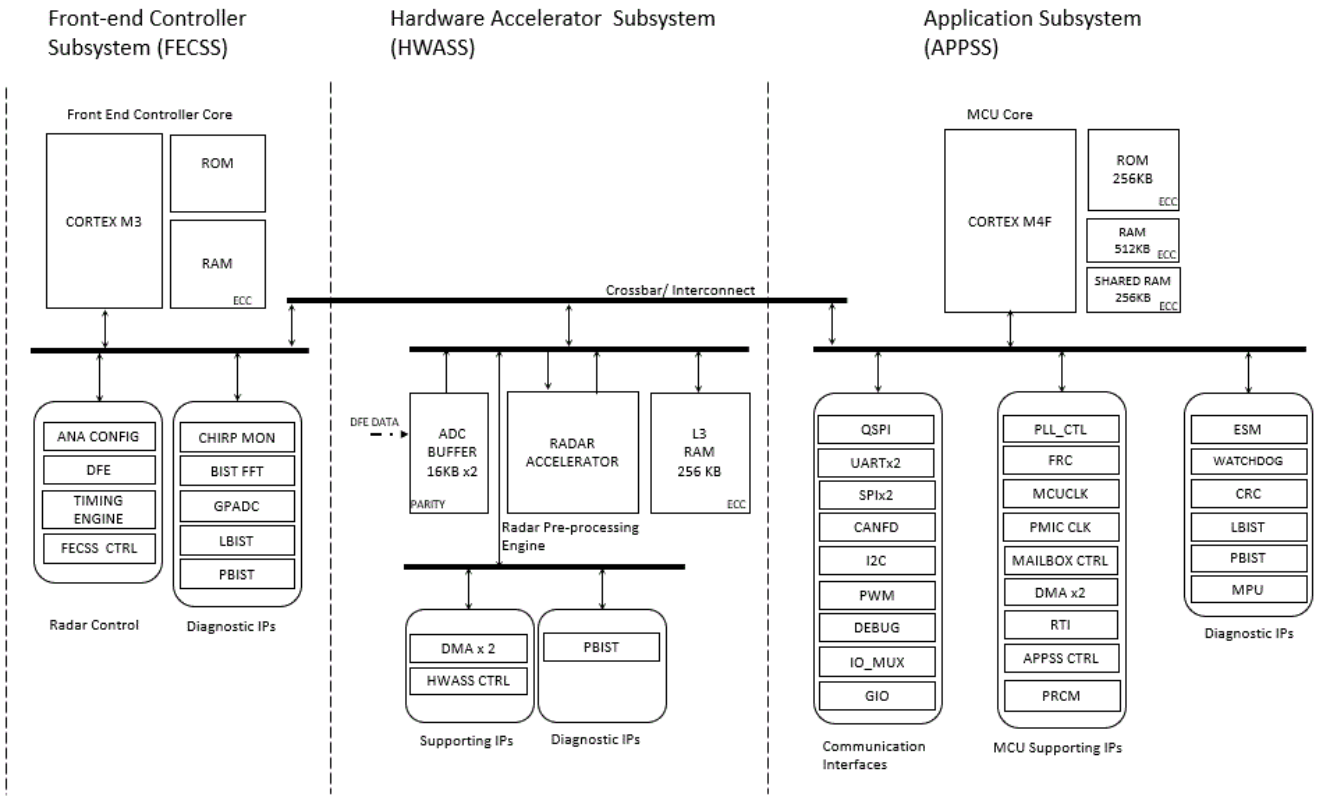

图 9-5. Processor Subsystem

图 9-5 shows the block diagram for customer programmable processor subsystems in the IWRL6432 device. At a high level there are two customer programmable subsystems, as shown separated by a dotted line in the diagram. The left hand side shows the HWA, a high-bandwidth interconnect for high performance (64-bit, 80MHz), and associated peripherals data transfer. RDIF interface for Measurement data output, L3 Radar data cube memory, the ADC buffers, the CRC engine, and data handshake memory (additional memory provided on interconnect).

The right side of the diagram shows the Main Subsystem. The Main Subsystem is the brain of the device and controls all the device peripherals and house-keeping activities of the device. The Main Subsystem contains Cortex-M4F processor and associated peripherals and house-keeping components such as DMAs, CRC and Peripherals (I^2C, UART, SPIs, CAN, PMIC clocking module, PWM, and others) connected to Main Interconnect through Peripheral Central Resource (PCR interconnect).

9.3.6 Host Interface

The host interface can be provided through a SPI, UART, or CAN-FD interface. In some cases the serial interface for industrial applications is transcoded to a different serial standard.

The IWRL6432 device communicates with the host radar processor over the following main interfaces:

- Reference Clock – Reference clock available for host processor after device wakeup
- Control – 4-port standard SPI (peripheral) for host control . All radio control commands (and response) flow through this interface.
- Reset – Active-low reset for device wakeup from host.
- Host Interrupt - an indication that the mmWave sensor needs host interface
- Error – Used for notifying the host in case the radio controller detects a fault

9.3.7 Main Subsystem Cortex-M4F

The main system includes an ARM Cortex M4F processor clocked with a maximum operating frequency of 160 MHz. User applications executing on this processor control the overall operation of the device, including radar control through well-defined API messages, radar signal processing (assisted by the radar hardware accelerator), and peripherals for external interfaces.

See the Technical Reference Manual for a complete description and memory map.

9.4 Other Subsystems

9.4.1 GPADC Channels (Service) for User Application

The IWRL6432 device includes provision for an ADC service for user application, where the GPADC engine present inside the device can be used to measure up to two external voltages. The GPADC1, and GPADC2 pins are used for this purpose.

- GPADC itself is controlled by TI firmware running inside the FEC subsystem and access to it for customer’s external voltage monitoring purpose is via ‘APPSS’ calls routed to the FEC subsystem. This API could be linked with the user application running on MSS M4F.
- Device Firmware package (DFP) provides APIs to configure and measure these signals. The API allows configuring the settling time (number of ADC samples to skip) and number of consecutive samples to take. At the end of a frame, the minimum, maximum and average of the readings will be reported for each of the monitored voltages.

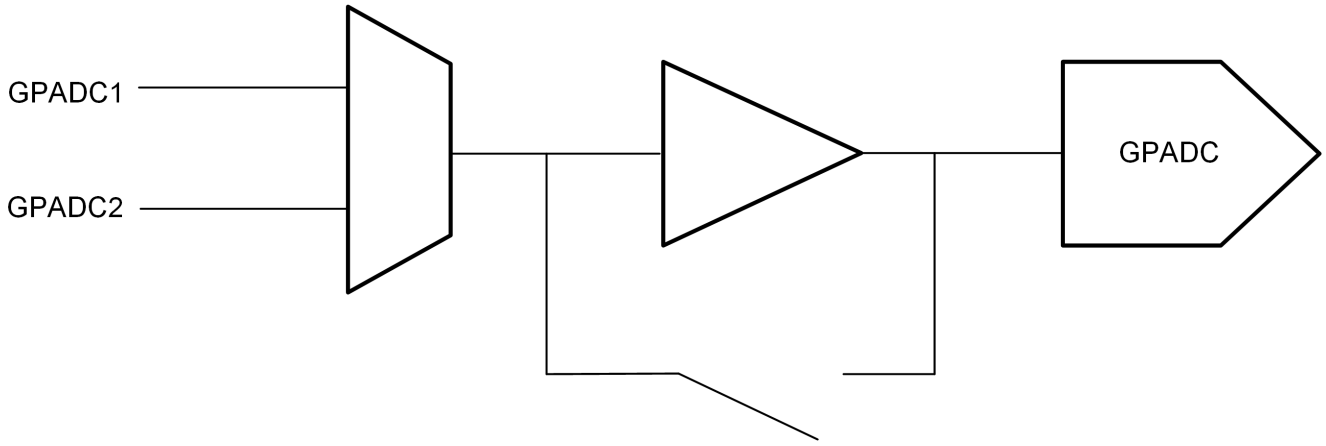

图 9-7. GPADC Path

GPADC structures are used for measuring the output of internal temperature sensors. The accuracy of these measurements is ±7°C.

9.5 Memory Partitioning Options

IWRL6432 devices will have a total memory of 1MB. The L3 memory has two memory banks and can be associated with radar cube memory or with the Cortex-M4F RAM.

表 9-1. Memory Partition Options

		Config 1	Config 2	Config 3

Application (M4F program + data)	Includes drivers, mmWavelink, BIOS	768KB	640KB	512KB
Total memory		1024KB	1024KB	1024KB

The entire RAM is retainable. Additionally, each memory cluster can be independently turned off (if needed). The clusters are defined as below

ADVANCE INFORMATION

表 9-2. Memory Retention Options

RAM_1			RAM_2		RAM_3	Shared	HWA
256KB			128KB		128KB	256KB	256KB
BANK #1(1)			BANK #2		BANK #3		
Cluster #1	Cluster #3	Cluster #4	Cluster #2	Cluster #5		Cluster #6	
64kB	64KB	128KB	16KB	112KB	128KB	256KB	256KB

(1) Retention memories have power switches. These Banks represent memory configurations.

9.6 Boot Modes

As soon as device reset is de-asserted, the processor of the APPSS starts executing its bootloader from an on-chip ROM memory.

The bootloader operates in three basic modes and these are specified on the user hardware (Printed Circuit Board) by configuring what are termed as "Sense on power" (SOP) pins. These pins on the device boundary are scanned by the bootloader firmware and choice of mode for bootloader operation is made.

表 9-3 enumerates the relevant SOP combinations and how these map to bootloader operation.

表 9-3. SOP Combinations

SOP1	SOP0	BOOTLOADER MODE AND OPERATION
0	0	**Flashing Mode** Device Bootloader spins in loop to allow flashing of user application (or device firmware patch - Supplied by TI) to the serial flash.
0	1	**Functional Mode** Device Bootloader loads user application from QSPI Serial Flash to internal RAM and switches the control to it.
1	1	**Debug Mode** Bootloader is bypassed and M4F processor is halted. This allows user to connect emulator at a known point.

11 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions follow.

11.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, *IWRL6432*). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

X Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.

P Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ABL0161), the temperature range (for example, blank is the default commercial temperature range). 图 11-1 provides a legend for reading the complete device name for any *IWRL6432* device.

For orderable part numbers of *IWRL6432* devices in the ABL0161 package types, see the Package Option Addendum of this document (when available), the TI website (www.ti.com), or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the *IWRL6432 Device Errata* .

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.
