

## TCA9517A 电平转换 I<sup>2</sup>C 总线中继器

### 1 特性

- 双通道双向缓冲器
- 与 I<sup>2</sup>C 总线和系统管理总线 (SMBus) 兼容
- 在 A 侧上, 运行电源电压范围为 0.9V 至 5.5V
- 在 B 侧上, 运行电源电压范围为 2.7V 至 5.5V
- 从 0.9V-5.5V 到 2.7V-5.5V 的电压电平转换
- 针对 PCA9515B 的封装和功能替代产品
- 高电平有效中继器启用输入
- 漏极开路 I<sup>2</sup>C I/O
- 5.5V 耐压 I<sup>2</sup>C 和使能输入支持混合模式信号操作
- 适用于标准模式和快速模式 I<sup>2</sup>C 器件和多重主器件
- 器件断电时 I<sup>2</sup>C 引脚呈高阻态
- 闩锁性能超出 JESD 78 II 类规范要求的 100mA
- 静电放电 (ESD) 保护性能超过 JESD 22 规范的要求
  - 5500V 人体放电模式 (A114-A)
  - 200V 机器放电模式 (A115-A)
  - 1000V 组件充电模式 (C101)

### 2 应用

- 服务器
- 路由器 (电信交换设备)
- 工业设备
- 具有多个 I<sup>2</sup>C 从器件和/或印刷电路板 (PCB) 走线较长的产品

### 3 说明

TCA9517A 是一款具有电平转换功能的双向缓冲器, 适用于 I<sup>2</sup>C 和 SMBus 系统。此器件可在混合模式应用中提供低电压 (低至 0.9V) 和较高电压 (2.7V 至 5.5V) 间的双向电压电平转换 (上行转换/下行转换)。接口的需要。该器件能够扩展 I<sup>2</sup>C 和 SMBus 系统, 甚至在电平转换期间也不会影响系统性能。

TCA9517A 可缓冲 I<sup>2</sup>C 总线上的串行数据 (SDA) 和串行时钟 (SCL) 信号, 因此允许 I<sup>2</sup>C 应用中的两条总线连接高达 400pF 的总线电容。

TCA9517A 具有两类驱动器: A 侧驱动器和 B 侧驱动器。所有输入和 I/O 均可耐受 5.5V 过压, 甚至在器件断电时 ( $V_{CCB}$  和/或  $V_{CCA} = 0V$ ) 也如此。

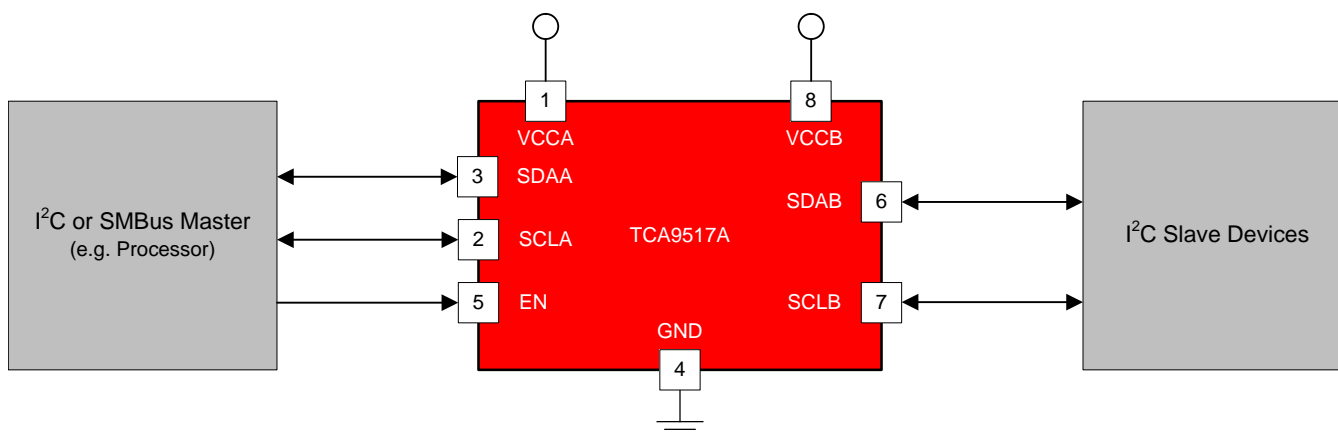

TCA9517A 的竞争电平阈值 ( $V_{ILC}$ ) 高于 TCA9517, 允许连接下拉能力较弱的从器件。

## 5 (说明 (续))

**B** 侧上的缓冲器设计类型使其无法与使用静态电压偏移的器件串联使用。这是因为这类器件并不将经缓冲的低电平信号识别为有效低电平，并且不再将其作为经缓冲的低电平进行传送。

**B** 侧驱动器运行电压介于 **2.7V** 至 **5.5V** 之间。针对这个内部缓冲器的输出低电平大约为 **0.5V**，但是当输出在内部被驱动为低电平时，输入电压必须比输出低电平低 **70mV** 或者更多。更高的电压低信号被称为经缓冲的低电平。当 **B** 侧 I/O 被内部驱动为低电平时，输入并不将此低电平识别为低电平。当输入低电平状态被释放时，这一特性防止了锁定情况的发生。

**A** 侧驱动器运行电压介于 **0.9V** 至 **5.5V** 之间并且能够驱动更大电流。它们不需要经缓冲的低电平特性（或者静态偏移电压）。这意味着，**B** 侧上的低电平信号将转换为 **A** 侧上接近 **0V** 的低电平，以适应低压逻辑的较小电压摆幅。**A** 侧上的输出下拉电阻会驱动一个“硬”低电平，输入电平会设置在  $0.3 \times V_{CCA}$  以满足低压侧电源电压低至 **0.9V** 的系统对于较低低电平的需求。

可将 **A** 侧作为公共总线，将两个或两个以上的 **TCA9517A** 的 **A** 侧连接在一起，从而实现多个拓扑结构（请参阅 [图 8](#) 和 [图 9](#)）。此外，还可以将 **A** 侧直接连接至任意具有静态或动态偏移电压的其他缓冲器。可以将多个 **TCA9517A** 串联在一起（相邻器件间通过 **A** 侧和 **B** 侧相连），偏移电压不会增大，只是需要考虑飞行时间延迟。由于 **B** 侧缓冲低电压的原因，**TCA9517A** 不能通过 **B** 侧相连。**B** 侧不能连接配有上升时间加速器的器件。

$V_{CCA}$  只能用于为 **A** 侧输入比较器提供  $0.3 \times V_{CCA}$  参考电压，或者用于电源正常状态检测电路。**TCA9517A** 逻辑和所有 I/O 均由  $V_{CCB}$  引脚供电。

当与标准  $I^2C$  系统一同工作时，需要用上拉电阻在经缓冲的总线上提供逻辑高电平。**TCA9517A** 具有  $I^2C$  总线的标准漏极开路配置。这些上拉电阻器的尺寸由系统决定，然而，中继器的每一侧都必须有一个上拉电阻器。此器件专为与标准模式及快速模式  $I^2C$  器件（而不单是 **SMBus** 器件）一起工作而设计。在可以接受标准模式器件和多个主控器的通用型 IC 系统中，标准模式  $I^2C$  器件的额定值仅为 **3mA**。在特定条件下，可以采用更高的终止电流。

## 9 Detailed Description

### 9.1 Overview

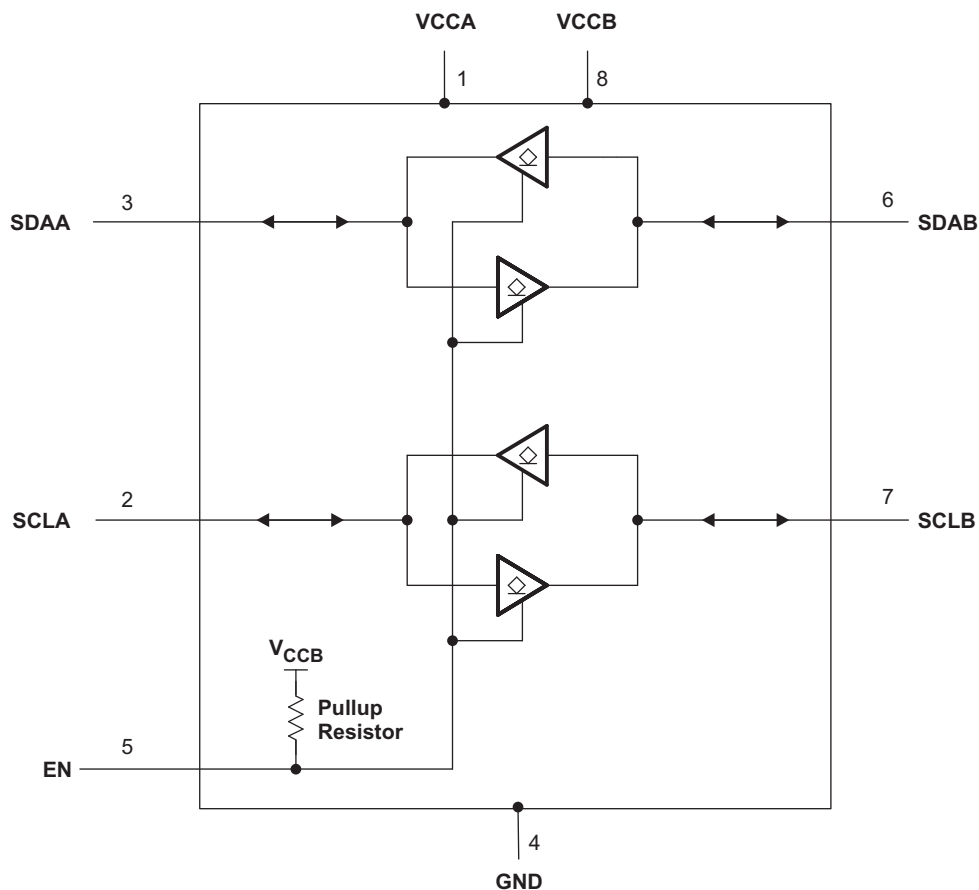

The TCA9517A is a bidirectional buffer with level shifting capabilities for I<sup>2</sup>C and SMBus systems. It provides bidirectional voltage-level translation (up-translation/down-translation) between low voltages (down to 0.9 V) and higher voltages (2.7 V to 5.5 V) in mixed-mode applications. This device enables I<sup>2</sup>C and SMBus systems to be extended without degradation of performance, even during level shifting.

The TCA9517A buffers both the serial data (SDA) and the serial clock (SCL) signals on the I<sup>2</sup>C bus, thus allowing two buses of up to 400-pF bus capacitance to be connected in an I<sup>2</sup>C application.

The TCA9517A has two types of drivers: A-side drivers and B-side drivers. All inputs and I/Os are over-voltage tolerant to 5.5 V, even when the device is unpowered ( $V_{CCB}$  and/or  $V_{CCA} = 0$  V).

The TCA9517A offers a higher contention level threshold,  $V_{ILC}$ , than the TCA9517, which allows connections to slaves which have weaker pull-down ability.

### 9.2 Functional Block Diagram

## 9.3 Feature Description

### 9.3.1 Two-Channel Bidirectional Buffer

The TCA9517A is a two-channel bidirectional buffer with level-shifting capabilities

### 9.3.2 Active-High Repeater-Enable Input

The TCA9517A has an active-high enable (EN) input with an internal pull-up to  $V_{CCB}$ , which allows the user to select when the repeater is active. This can be used to isolate a badly behaved slave on power-up reset. The EN input should change state only when the global bus and repeater port are in an idle state, to prevent system failures.

### 9.3.3 $V_{OL}$ B-Side Offset Voltage

The B-side drivers operate from 2.7 V to 5.5 V. The output low level for this internal buffer is approximately 0.5 V, but the input voltage must be 70 mV or more below the output low level when the output internally is driven low. The higher-voltage low signal is called a buffered low. When the B-side I/O is driven low internally, the low is not recognized as a low by the input. This feature prevents a lockup condition from occurring when the input low condition is released. This type of design prevents 2 B-side ports from being connected to each other.

### 9.3.4 Standard Mode and Fast Mode Support

The TCA9517A supports standard mode as well as fast mode  $I^2C$ . The maximum system operating frequency will depend on system design and the delays added by the repeater.

### 9.3.5 Clock Stretching Support

The TCA9517A can support clock stretching, but care needs to be taken to minimize the overshoot voltage presented during the hand-off between the slave and master. This is best done by increasing the pull-up resistor value.

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

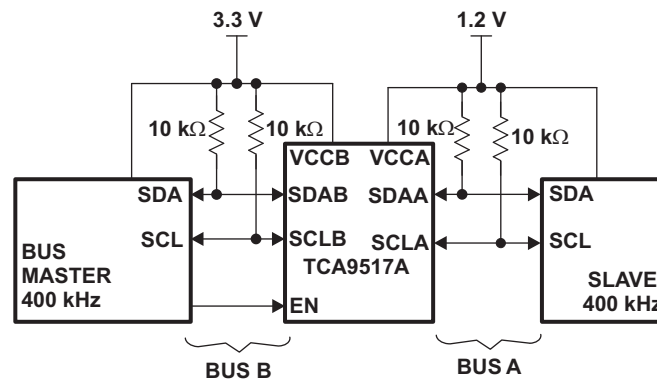

A typical application is shown in [Figure 7](#). In this example, the system master is running on a 3.3 V I<sup>2</sup>C bus, and the slave is connected to a 1.2 V I<sup>2</sup>C bus. Both buses run at 400 kHz. Master devices can be placed on either bus.

The TCA9517A is 5-V tolerant, so it does not require any additional circuitry to translate between 0.9 V to 5.5 V bus voltages and 2.7 V to 5.5 V bus voltages.

When the A side of the TCA9517A is pulled low by a driver on the I<sup>2</sup>C bus, a comparator detects the falling edge when it goes below  $0.3 \times V_{CCA}$  and causes the internal driver on the B-side to turn on, causing the B-side to pull down to about 0.5 V. When the B-side of the TCA9517A falls, first a CMOS hysteresis-type input detects the falling edge and causes the internal driver on the A side to turn on and pull the A-side pin down to ground. In order to illustrate what would be seen in a typical application, refer to [Figure 9](#) and [Figure 10](#). If the bus master in [Figure 7](#) were to write to the slave through the TCA9517A, waveforms shown in [Figure 9](#) would be observed on the A bus. This looks like a normal I<sup>2</sup>C transmission, except that the high level may be as low as 0.9 V, and the turn on and turn off of the acknowledge signals are slightly delayed.

On the B-side bus of the TCA9517A, the clock and data lines would have a positive offset from ground equal to the  $V_{OL}$  of the TCA9517A. After the eighth clock pulse, the data line is pulled to the  $V_{OL}$  of the slave device, which is very close to ground in this example. At the end of the acknowledge, the level rises only to the low level set by the driver in the TCA9517A for a short delay, while the A-bus side rises above  $0.3 \times V_{CCA}$  and then continues high.

### 10.2 Typical Application

**Figure 7. Typical Application Schematic**

#### 10.2.1 Design Requirements

For the level translating application, the following should be true:

- $V_{CCA} = 0.9 \text{ V to } 5.5 \text{ V}$
- $V_{CCB} = 2.7 \text{ to } 5.5 \text{ V}$
- B-side ports must not be connected together

## Typical Application (continued)

### 10.2.2 Detailed Design Procedure

#### 10.2.2.1 Clock Stretching Support

The TCA9517A can support clock stretching, but care needs to be taken to minimize the overshoot voltage presented during the hand-off between the slave and master. This is best done by increasing the pull-up resistor value.

#### 10.2.2.2 $V_{ILC}$ and Pullup Resistor Sizing

For the TCA9517A to function correctly, all devices on the B-side must be able to pull the B-side below the voltage input low contention level ( $V_{ILC}$ ). This means that the  $V_{OL}$  of any device on the B-side must be below 0.45 V.

$V_{OL}$  of a device can be adjusted by changing the  $I_{OL}$  through the device which is set by the pull-up resistance value. The pull-up resistance on the B-side must be carefully selected to ensure that logic levels will be transferred correctly to the A-side.

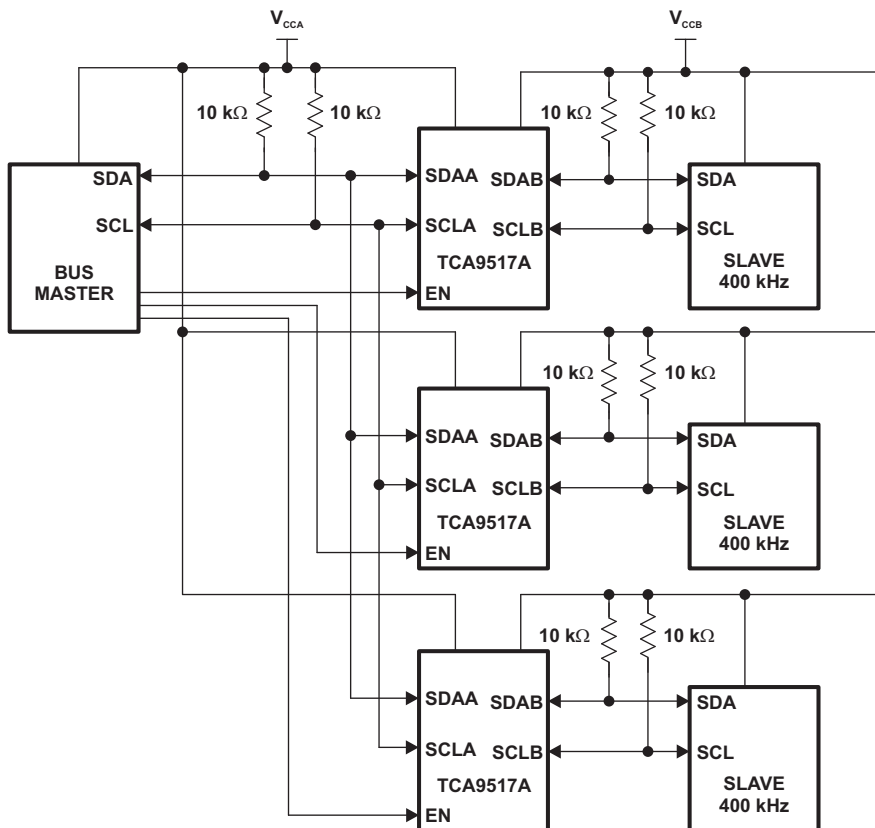

Figure 8. Typical Star Application

Multiple A sides of TCA9517As can be connected in a star configuration, allowing all nodes to communicate with each other.

Typical Application (continued)

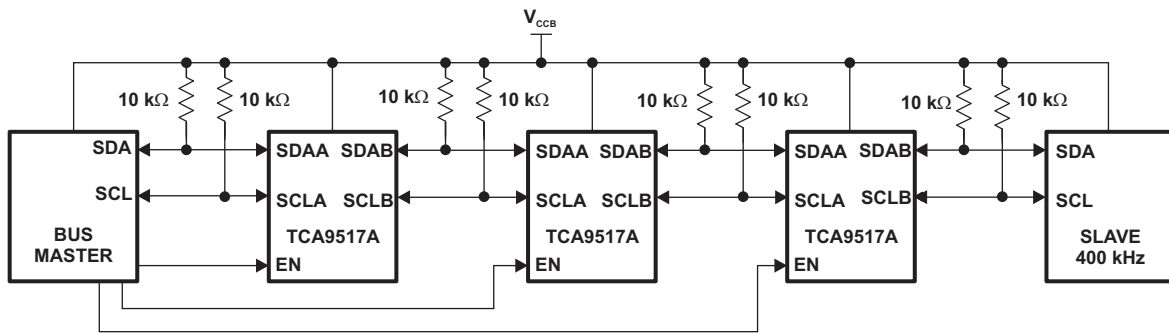

Figure 9. Typical Series Application

To further extend the I<sup>2</sup>C bus for long traces/cables, multiple TCA9517As can be connected in series as long as the A-side is connected to the B-side. I<sup>2</sup>C bus slave devices can be connected to any of the bus segments. The number of devices that can be connected in series is limited by repeater delay/time-of-flight considerations on the maximum bus speed requirements.

**11 Power Supply Recommendations**

$V_{CCB}$  and  $V_{CCA}$  can be applied in any sequence at power up. The TCA9517A includes a power-up circuit that keeps the output drivers turned off until  $V_{CCB}$  is above 2.5 V and the  $V_{CCA}$  is above 0.8 V. After power up and with the EN high, a low level on the A-side (below  $0.3 \times V_{CCA}$ ) turns the corresponding B-side driver (either SDA or SCL) on and drives the B-side down to approximately 0.5 V. When the A-side rises above  $0.3 \times V_{CCA}$ , the B-side pull-down driver is turned off and the external pull-up resistor pulls the pin high. When the B-side falls first and goes below  $0.3 \times V_{CCB}$ , the A-side driver is turned on and the A-side pulls down to 0 V. The B-side pull-down is not enabled unless the B-side voltage goes below 0.4 V. If the B-side low voltage does not go below 0.5 V, the A-side driver turns off when the B-side voltage is above  $0.7 \times V_{CCB}$ . If the B-side low voltage goes below 0.4 V, the B-side pull-down driver is enabled, and the B-side is able to rise to only 0.5 V until the A-side rises above  $0.3 \times V_{CCA}$ .

TI recommends using a decoupling capacitor and placing it close to the  $V_{CCA}$  and  $V_{CCB}$  pins of a value of about 100 nF.

## 12 Layout

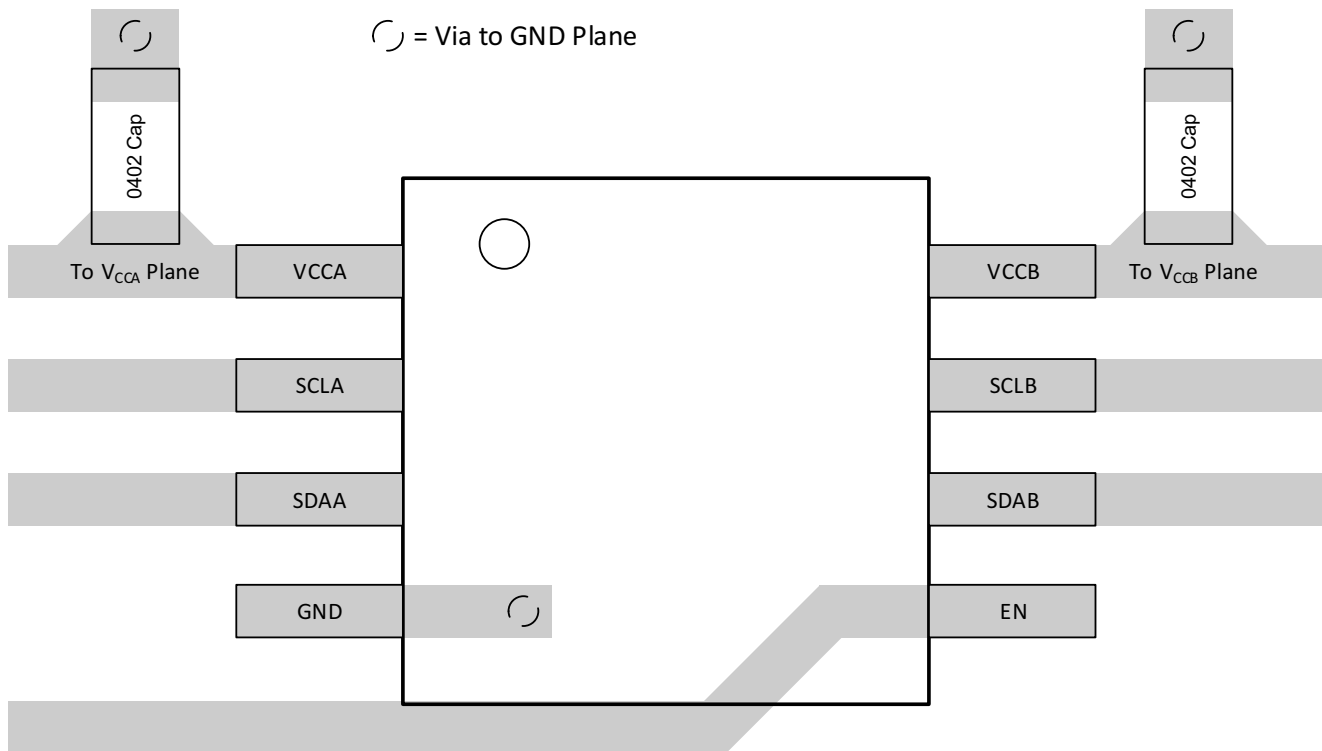

### 12.1 Layout Guidelines

There are no special layout procedures required for the TCA9517A.

It is recommended that the decoupling capacitors be placed as close to the VCC pins as possible.

## 14 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
  - E. Falls within JEDEC MO-187 variation AA, except interlead flash.

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
